- 1. This measurement is unacceptable. There are several factors justifying this. The first is that as we know, we are never satisfied with just one measurement. Although we cannot measure again, we cannot use this as the entirety of our data. The second is that one point of data counts as a small set. This means that we will calculate  $\sigma_{n-1}$  rather than  $\sigma_n$ . Since n=1, n-1=0. We cannot divide by 0 no matter what we do. That is why such a measurement is unacceptable.
